

## MySurveillix

MySurveillix\* is a web-based service that manages the health of your surveillance system. Simple to use, it provides easy-to-understand visual confirmation of the proper operation of Toshiba Surveillix® recorders and cameras, including bringing to your immediate attention problems that may exist so they can be fixed before a critical video event occurs. MySurveillix delivers to you these important benefits:

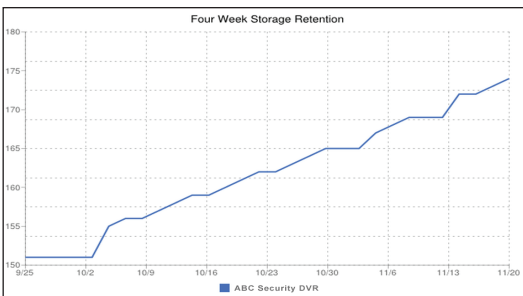

### Health Monitoring

Health Monitoring provides an easy to understand visual tool to quickly verify a recorder's health. Define filters for alarms to alert via SMS or email. Fix a problem when it happens and not after critical video has failed to be captured. Reports can be generated daily, weekly or monthly.

Alerts can include

- Camera not connected or not recording
- Hard-drive issues detected
- Recorder down or unexpectedly rebooted
- Minimum recording duration not being met

### Recording Duration

Recording Duration not only gives a visual representation of a recorder's video retention capabilities, it allows setting a recording threshold and programming alert notification when it is not being met.

### Camera Image Verification

Camera Image Verification illustrates more than if the camera is just working. It shows if the camera is recording what it was intended to and that certain functions like IR illumination are functioning properly.

Takes day & night thumbnail images to ensure all camera are working properly and capturing the same image as intended when installed.
